## **Applications**

- Water supply and pressure boosting: Pressure boosting in buildings, hotels, residential complexes Pressure booster stations, supply of water networks Pressure boosting for industrial water supply.
- Light industry: Washing and cleaning systems, Car washing facilities, Fire fighting systems, Process water systems, Machine tools (cooling lubricants).
- Heating, Ventialation and Air-Conditioning: Boilers, Induction heating, Heat exchangers, Refrigerators, Cooling towers and systems, Temperature control systems.
- Irrigation and Agriculture: Greenhouses, Sprinkler irrigation, Field irrigation (flooding).
- Water Treatment: Water softeners and de-mineralization, Reverse Osmosis systems, Distillation systems, Filtration, Ultra-filtration systems.

#### Pump

The VM, VMC and VMN pumps are non-self priming vertical multistage pump of in line design, flange or with Victaulic coupling with equally sized suction and descharge ports. Stage construction with stainless steel impellers, chambers and pressure casing. Pump stub shaft and motor shaft of the IEC- standards motor are directly close coupled. All pumps are equipped with a catridge type mechanical seal for easy maintenance.

VM, VMC and VMN pumps have different pump sizes and various numbers of stages to provide the flow and the pressure required.

#### **Electrical motor**

- Squirrel cage in short circuit, aluminum casing up to 22 kW, totally enclosed, fan-cooled, 2-pole standard motor.
- Standard supply SPCO motors.
- Enclosure class: IP55
- Insulation class: F
- Standard voltages: P2: 0.37 1.1kW : 3 x 220 255/380 440 V

P2: 1.5 - 7.5kW : 3 x 220 - 277/380 - 480 V

P2: From 11 kW 3 x 220 / 380 / 440 V

- The motors have efficiency values that fall within the range normally referred to as EFF.1
- Ambient temperature : Max. + 50  $^{\circ}$  C

#### **Mechanical Seals**

Standard Cartridge type Mechanical seal made of Silicon Carbide/Silicon Carbide/EPDM or Viton. Based on the type of application, alternative materials are available for the seal and the elastomers. The catridge type mechanical seal can be replaced in minutes without special tools and without dismantling the pump.

#### **List of Materials**

Q : Silicon carbide	E : EPDM
U : Tungsten carbide	V : Viton
B : Carbon

(4-2)	30 bar	(2-1) - (4-2)	15 bar

• Rule to follow: the inlet pressure + the pressure against a closed valve < Max. operating pressure.

Conditions for the performance curves:

• Curve tolerance in conformity with ISO9906, appendix A.

• Measurement is done with 20 °C air-free water, kinematic viscosity of 1mm2 /sec.

• The operation of pump shall refer to the performance region indicated by the thickened curve

to prevent overheating due to too small flow rate

or overload of motor due to too large flow rate.

#### **Minimum inlet pressure NPSH**

In case that the pressure in pump is lower than the steam pressure used to convey liquid, the cavitations will occur. To avoid cavitations, a minimum pressure at the inlet side of the pump shall be guaranteed. The maximum suction stroke can be calculated with following formula:

H = Pb x 10.2 - NPSH - Hf - Hv - Hs

Pb = atmosphere pressure [bar] (can be set as 1bar)

In a closed system, Pb means system pressure [bar]

NPSH= Net positive suction head [m], It can be read out from the point of possible max. flow rate shown on NPSH curve

Hf = Pipeline loss at the inlet [m] Hv = Steam pressure [m] Hs = Safety margin Minimum 0.5m delivery head

If the calculated result H is positive, the pump may run under the max. suction stroke H. In case the calculated result H is negative, a delivery head of min. inlet pressure is necessary.

Check and ensure that the pump is not at cavitation state.

#### **Operation in parallel**

- Connecting several pumps in a parallel running mode will benefit the reliability of the system compared to a single pump system.
- Applicable to different working states required by a variable flow system.
- Increasing the availability of water supply if a pump fails: only a part of the system flow is effected.

Two pumps or more can be connected in parallel running if necessary.

#### **Pumped Liquids**

VM, VMC, VMN pumps can handle a wide variety of liquids, each with its own characteristic. VM, VMC

Non-corrosive liquids

For fluid transfer, circulation and pressure boosting of cold or hot clean water.

VMN

Industrial liquids

Light acids

The fluids covered in the list are not complete. Data on the application limits of different pump materials when handling any of the listed fluids are considered to be the best choices. However, the table is intended as a general guide only, and cannot replace actual testing of the pumped fluids and pump materials under specific working conditions.

When choosing the pump version, sufficient attention should be given to the flow medium, such as density, solidification point, viscosity as well as ex-protection requirement. The limits of applicability of the pumps, based on pressure and temperature must also be considered.
